Title	Pub. Date	Int. Class	App. Num	Applicant
1. (WO 2002/003190) SYSTEM FOR LINKING DATA CELLS THROUGH PERMUTATION	10.01.2002	G06F 7/00	PCT/US2001/021045	INFORMATI(INC.

A method and system is presented for storing data in data cells (100) that contain only a single element of data. Each data includes four components: an Entity Instance identifier ('O') (102), an Entity Type identifier ('E') (104) and Attribute Type id (106), and an Attribute Value 'V') (108). Groups of cells (100) with identical O (102) and E constitute a cell set (101). Relati between cell sets (101) are created through the use of linking or synapse cells (110) that are created through a process of transmutation. Through the use of cell generations (204-210), it is possible to store information about attributes, entities, re constraints, and default data formats in the same cell listing as the c...
